Sehr geehrte Kunden! Auf dem folgenden Tabellenblatt finden Sie unsere Preise für SPE Material von Agela Technologies.

Bestellungen können per e-mail, Fax oder auch telefonisch abgegeben werden.

Lieferkonditionen Österreich:

DHL:

6 €

Lieferkonditionen Deutschland:

DHL:

10 €

Bei Bestellwert über 150€ werden keine Transportkosten verrechnet.

Für das SPE Material von Agela Technologies haben wir folgende Discountstaffeln:

5 Pack:	-5%	Sonderrabatt
10 Pack:	-10%	Sonderrabatt (egal welche Kombination)
25 Pack:	-15%	Sonderrabatt (egal welche Kombination)
50+ Pack:	-20%	Sonderrabatt (egal welche Kombination)

Bis 31.07.2009 gelten folgende Discountstaffeln:

Generell	-25%	CSS Rabatt
-----------------	-------------	------------

Alle Preise verstehen sich exkl. MwSt.

Cleanert ODS (C18, end-capped)

ODS C18 products have silica based reversed phase sorbents bonded with octadecylsilane, which have high bonding density (C%>17), double endcapped, used as replacement of BondElute C18 and Super clean ENVI C18. These products could also be used for desalting of bio-molecular samples such as proteins and DNAs. C%: 18-19%;60Å;0.8cm²/g;480m²/g

Cleanert ODS-N(C18, non-end-capped)

ODS C18 products have silica based reverse phase sorbents bonded with octadecylsilane without endcap. The extra silanol residue of the sorbent provides additional polar interactions associated with surface silanol groups which enhance retention of basic compounds. These columns are similar to Agilent AccuBond C18 and BondElute C18 OH. C%: 17-18%;60Å;0.8cm²/g;480m²/g

Cleanert C8

The property of C8 products is similar to ODS C18 products. However, this sorbent is slightly less retentive than C18, which facilitates the elution of more hydrophobic substance. C8 SPE is successfully used for the extraction of both water-soluble and fat-soluble vitamins from serum, as well as the desalting of biological macromolecules. C%: 9-10%;60Å;0.8cm²/g;480m²/g

Cleanert CN

Cyano(CN) SPE have silica based sorbents bonded with cyanopropyl functionality. This polarsorbent exhibits both polar and non-polar interactions. It can be used for extraction of both polar and non-polar molecules in either normal phase or reverse phase mode. C%: 5-6%;60Å;0.8cm²/g;480m²/g

Cleanert NH2

NH₂ SPE products have silica based sorbents bonded with aminopropyl functionality. This sorbent can be used in either normal phase or reverse phase mode. It retains the analytes either by a polar adsorption (from non-polar solution) or by weak anion exchange (from aqueous solution). pK_a=9.8. 60Å;0.8cm²/g;480m²/g

Cleanert Silica

Silica SPE product has unbonded, be activated irregular silica as the sorbent. This sorbent exhibits high polar interaction and is used for the extraction of weak-polar or non-polar compound, such as oil. In addition, the silanol groups are ionizable at intermediate pH, so it can be used as a weak cation exchanger. 60Å;0.8cm²/g;480m²/g

Cleanert SAX

SAX SPE products have silica based sorbents bonded with a quaternary amine. This strong anion exchanger is used to extract compounds capable of carrying a negative charge from both aqueous and non-aqueous solutions. They are ideally suited to extraction of weak acids and desalting of biological macromolecules, like BondElute-SAX. 60Å;0.8cm²/g;480m²/g;0.5meq/g.

Cleanert SCX

SCX products are strong cation exchangers based on silica gel, with benzene sulfonic acid. The sorbent is used to extract positively charged basic compounds or remove the salt from biological samples. It can also be mixed with C18 sorbent to extract the organic bases. 60Å; 0.8cm²/g; 480m²/g; 0.5meq/g.

Cleanert PEP, replacement for Waters Oasis HLB

PEP is made of the polydivinylbenzene having a surface functionalized with vinyl prorolidone. They can be used in the entire pH 1-14. The surface has a balanced hydrophilic and hydrophobic property and can extract a variety of polar and non-polar compounds. Some strong hydrophilic compounds, which have little retention on the C18 column, can be effectively retained, such as chlorinated phenols, phosphate esters and drug metabolites. Adsorption sorbents; Average pore size: 80Å; Surface area: 600m²/g

Cleanert PCX, replacement for Waters Oasis MCX

Cleanert PCX provides the dual modes of retention, ion exchange and reverse phase on the stable, high surface area, organ co-polymer. And it is stable from pH 0-14. Based on polystyrene/divinylbenzene; Average pore size: 70Å; Volume of pore: 1.2cm³/g; Specific surface area: 600m²/g.

Cleanert PAX, replacement for Waters Oasis MAX

It is designed to overcome the limitations of traditional silica based mixed-mode SPE sorbents such as SAX. It is a strong anion-exchange, mixed mode water-wettable, polystyrene/divinylbenzene sorbent stable from pH 0-14. Based on polystyrene/divinylbenzene; Average pore size: 70Å; Volume of pore: 1.2cm³/g; Specific surface area: 600m²/g.
